

2H TUBEdek® LAMELLA CLARIFIERS FOR ROUND TANKS

ENEXIO Water Technologies' concepts combine the advantages of the parallel plate separator technology with those of round sedimentation tanks.

2H TUBEdek® lamella clarifiers present the ideal solution for round tanks which are overloaded and where there is no room for expansion. 2H TUBEdek® lamella separators increase the plant capacity by enlarging the sedimentation area considerably.

Depending on the application there are different possibilities to install lamella clarifiers in round tanks.

Tank diameter 5-20 m – Installation in an outer ring

Tangential configuration

2H TUBEdek® lamella clarifiers can be installed tangentially in a ring at the outer rim of the tank. For this configuration, the width of the ring may not exceed 3 m and the inner diameter of the tank has to be larger than 12 m.

Radial configuration

For higher sludge loads and smaller inner diameters we recommend installing the 2H TUBEdek® modules radially. This can be done by cutting the modules into segments like pieces of a cake. The form of the edge profiles allows for an installation without dead ends.

Tank diameter smaller than 10 m

Parallel configuration

For smaller tanks the configuration which suits most is to position the 2H TUBEdek® clarifiers parallel and cut the outside modules to adjust to the circular form of the tank. A simple cut out enables the installation of a centrally driven scraper.
